(54) Title: A BUILDING BLOCK CAPABLE OF TRANSFERRING A FUNCTIONAL ENTITY

(57) Abstract: A building block having the dual capabilities of transferring the genetic information e.g. by recognising an encoding element and transferring a functional entity to a recipient reactive group is disclosed. The building block can be designed with an adjustable transferability taking into account the components of the building block. The building block may be used in the generation of a single complex or libraries of different complexes, wherein the complex comprises an encoded molecule linked to an encoding element. Libraries of complexes are useful in the quest for pharmaceutically active compounds.

Title

A BUILDING BLOCK CAPABLE OF TRANSFERRING A FUNCTIONAL ENTITY

Technical Field of the Invention

5 The present invention relates to a building block comprising a complementing element and precursor for a functional entity. The building block is designed to transfer the functional entity with an adjustable efficiency to a recipient reactive group upon recognition between the complementing element and an encoding element associated with the reactive group. The invention also relates to a linkage between the
10 functional entity and the complementing element as well as a method for transferring a functional entity to recipient reactive group.

Background

15 The transfer of a chemical entity from one mono-, di- or oligonucleotide to another has been considered in the prior art. Thus, N. M. Chung *et al.* (Biochim. Biophys. Acta, 1971, 228, 536-543) used a poly(U) template to catalyse the transfer of an acetyl group from 3'-O-acetyladenosine to the 5'-OH of adenosine. The reverse transfer, i.e. the transfer of the acetyl group from a 5'-O-acetyladenosine to a 3'-OH group of another adenosine, was also demonstrated.

20 Walder *et al.* Proc. Natl. Acad. Sci. USA, 1979, 76, 51-55 suggest a synthetic procedure for peptide synthesis. The synthesis involves the transfer of nascent immobilized polypeptide attached to an oligonucleotide strand to a precursor amino acid attached to an oligonucleotide. The transfer comprises the chemical attack of the
25 amino group of the amino acid precursor on the substitution labile peptidyl ester, which in turn results in an acyl transfer. It is suggested to attach the amino acid precursor to the 5' end of an oligonucleotide with a thiol ester linkage.

30 The transfer of a peptide from one oligonucleotide to another using a template is disclosed in Bruick RK *et al.* Chemistry & Biology, 1996, 3:49-56. The carboxy terminal of the peptide is initially converted to a thioester group and subsequently transformed to an activated thioester upon incubation with Ellman's reagent. The activated thioester is reacted with a first oligo, which is 5'-thiol-terminated, resulting in the formation of a thio-ester linked intermediate. The first oligonucleotide and a
35 second oligonucleotide having a 3' amino group is aligned on a template such that

the thioester group and the amino group are positioned in close proximity and a reaction is effected resulting in a coupling of the peptide to the second oligonucleotide through an amide bond.

- 5 In an aspect of the present invention a storable oligonucleotide conjugated to a transferable chemical moiety is provided. In another aspect of the invention an oligonucleotide conjugate which is possible to prepare in a few steps is provided. In yet another aspect an arsenal of possibilities for adjusting the transferability of a chemical moiety is provided. Adjusting the transferability of a chemical moiety may
10 prove crucial in obtaining specific reactions.

Summary of the Invention

The present invention relates to a building block of the general formula

- 15 **Complementing Element – Linker – Carrier – C-F-connecting group – Functional entity precursor**

capable of transferring a functional entity to a recipient reactive group, wherein

Complementing Element is a group identifying the functional entity precursor,

- 20 **Linker** is a chemical moiety comprising a **Spacer** and a **S-C-connecting group**, wherein the Spacer is a valence bond or a group distancing the functional entity precursor to be transferred from the complementing element and the S-C-connecting group connects the spacer with the Carrier,

Carrier is selected among the groups

R⁵ is selected independently from -N₃, -CNO, -C(NOH)NH₂, -NHOH, -NHNHR⁶, -C(O)R⁶, -SnR⁶₃, -B(OR⁶)₂, -P(O)(OR⁶)₂ or the group consisting of C₂-C₆ alkenyl, C₂-C₆ alkynyl, C₄-C₈ alkadienyl said group being substituted with 0-2 R⁷,

20 where R⁶ is selected independently from H, C₁-C₆ alkyl, C₃-C₇ cycloalkyl, aryl or C₁-C₆ alkylene-aryl substituted with 0-5 halogen atoms selected from -F, -Cl, -Br, and -I; and R⁷ is independently selected from -NO₂, -COOR⁶, -COR⁶, -CN, -OSiR⁶₃, -OR⁶ and -NR⁶₂.

R⁸ is H, C₁-C₆ alkyl, C₂-C₆ alkenyl, C₂-C₆ alkynyl, C₃-C₇ cycloalkyl, aryl or C₁-C₆ alkylene-aryl substituted with 0-3 substituents independently selected from -F, -Cl, -NO₂, -R³, -OR³, -SiR³₃

25 R⁹ is =O, -F, -Cl, -Br, -I, -CN, -NO₂, -OR⁶, -NR⁶₂, -NR⁶-C(O)R⁸, -NR⁶-C(O)OR⁸, -SR⁶, -S(O)R⁶, -S(O)₂R⁶, -COOR⁶, -C(O)NR⁶₂ and -S(O)₂NR⁶₂.

30 In the present description and claims, the direction of connections between the various components of a building block should be read left to right. For example an S-C-connecting group -C(=O)-NH- is connected to a Spacer through the carbon atom on the left and to a Carrier through the nitrogen atom on the right hand side.

The term "C₃-C₇ cycloheteroalkyl" as used herein refers to a radical of totally saturated heterocycle like a cyclic hydrocarbon containing one or more heteroatoms selected from nitrogen, oxygen, phosphor, boron and sulphur independently in the cycle such as pyrrolidine (1- pyrrolidine; 2- pyrrolidine; 3- pyrrolidine; 4- pyrrolidine; 5- pyrrolidine); pyrazolidine (1- pyrazolidine; 2- pyrazolidine; 3- pyrazolidine; 4- pyrazolidine; 5- pyrazolidine); imidazolidine (1- imidazolidine; 2- imidazolidine; 3- imidazolidine; 4- imidazolidine; 5- imidazolidine); thiazolidine (2- thiazolidine; 3- thiazolidine; 4- thiazolidine; 5- thiazolidine); piperidine (1- piperidine; 2- piperidine; 3- piperidine; 4- piperidine; 5- piperidine; 6- piperidine); piperazine (1- piperazine; 2- piperazine; 3- piperazine; 4- piperazine; 5- piperazine; 6- piperazine); morpholine (2- morpholine; 3- morpholine; 4- morpholine; 5- morpholine; 6- morpholine); thiomorpholine (2- thiomorpholine; 3- thiomorpholine; 4- thiomorpholine; 5- thiomorpholine; 6- thiomorpholine); 1,2-oxathiolane (3-(1,2-oxathiolane); 4-(1,2-oxathiolane); 5-(1,2-oxathiolane); 1,3-dioxolane (2-(1,3-dioxolane); 4-(1,3-dioxolane); 5-(1,3-dioxolane); tetrahydropyrane; (2-tetrahydropyrane; 3-tetrahydropyrane; 4-tetrahydropyrane; 5-tetrahydropyrane; 6-tetrahydropyrane); hexahydropyridazine (1-(hexahydropyridazine); 2-(hexahydropyridazine); 3-(hexahydropyridazine); 4-(hexahydropyridazine); 5-(hexahydropyridazine); 6-(hexahydropyridazine)), [1,3,2]dioxaborolane, [1,3,6,2]dioxazaborocane

The term "aryl" as used herein includes carbocyclic aromatic ring systems of 5-7 carbon atoms. Aryl is also intended to include the partially hydrogenated derivatives of the carbocyclic systems as well as up to four fused aromatic- or partially hydrogenated rings, each ring comprising 5-7 carbon atoms.

The term "heteroaryl" as used herein includes heterocyclic unsaturated ring systems containing, in addition to 2-18 carbon atoms, one or more heteroatoms selected from nitrogen, oxygen and sulphur such as furyl, thienyl, pyrrolyl, heteroaryl is also intended to include the partially hydrogenated derivatives of the heterocyclic systems enumerated below.

The terms "aryl" and "heteroaryl" as used herein refers to an aryl which can be optionally substituted or a heteroaryl which can be optionally substituted and includes phenyl, biphenyl, indenyl, naphthyl (1-naphthyl, 2-naphthyl), N-hydroxytetrazolyl, N-hydroxytriazolyl, N-hydroxyimidazolyl, anthracenyl (1-anthracenyl, 2-anthracenyl, 3-anthracenyl), thiophenyl (2-thienyl, 3-thienyl), furyl (2-furyl, 3-furyl), indolyl, oxadiazolyl, isoxazolyl, quinazolinyl, fluorenyl, xanthenyl,

isoidanyl, benzhydryl, acridinyl, thiazolyl, pyrrolyl (2-pyrrolyl), pyrazolyl (3-pyrazolyl), imidazolyl (1-imidazolyl, 2-imidazolyl, 4-imidazolyl, 5-imidazolyl), triazolyl (1,2,3-triazol-1-yl, 1,2,3-triazol-2-yl, 1,2,3-triazol-4-yl, 1,2,4-triazol-3-yl), oxazolyl (2-oxazolyl, 4-oxazolyl, 5-oxazolyl), thiazolyl (2-thiazolyl, 4-thiazolyl, 5-thiazolyl), pyridyl (2-pyridyl, 3-pyridyl, 4-pyridyl), pyrimidinyl (2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 6-pyrimidinyl), pyrazinyl, pyridazinyl (3-pyridazinyl, 4-pyridazinyl, 5-pyridazinyl), quinolyl (2-quinolyl, 3-quinolyl, 4-quinolyl, 5-quinolyl, 6-quinolyl, 7-quinolyl, 8-quinolyl), isoquinolyl (1-isoquinolyl, 3-isoquinolyl, 4-isoquinolyl, 5-isoquinolyl, 6-isoquinolyl, 7-isoquinolyl, 8-isoquinolyl),

benzo[b]furanyl (2-benzo[b]furanyl, 3-benzo[b]furanyl, 4-benzo[b]furanyl, 5-benzo[b]furanyl, 6-benzo[b]furanyl, 7-benzo[b]furanyl), 2,3-dihydro-benzo[b]furanyl (2-(2,3-dihydro-benzo[b]furanyl), 3-(2,3-dihydro-benzo[b]furanyl), 4-(2,3-dihydro-benzo[b]furanyl), 5-(2,3-dihydro-benzo[b]furanyl), 6-(2,3-dihydro-benzo[b]furanyl), 7-(2,3-dihydro-benzo[b]furanyl), benzo[b]thiophenyl (2-benzo[b]thiophenyl, 3-benzo[b]thiophenyl, 4-benzo[b]thiophenyl, 5-benzo[b]thiophenyl, 6-benzo[b]thiophenyl, 7-benzo[b]thiophenyl), 2,3-dihydro-benzo[b]thiophenyl (2-(2,3-dihydro-benzo[b]thiophenyl), 3-(2,3-dihydro-benzo[b]thiophenyl), 4-(2,3-dihydro-benzo[b]thiophenyl), 5-(2,3-dihydro-benzo[b]thiophenyl), 6-(2,3-dihydro-benzo[b]thiophenyl), 7-(2,3-dihydro-benzo[b]thiophenyl), indolyl (1-indolyl, 2-indolyl, 3-indolyl, 4-indolyl, 5-indolyl, 6-indolyl, 7-indolyl), indazole (1-indazolyl, 3-indazolyl, 4-indazolyl, 5-indazolyl, 6-indazolyl, 7-indazolyl), benzimidazolyl (1-benzimidazolyl, 2-benzimidazolyl, 4-benzimidazolyl, 5-benzimidazolyl, 6-benzimidazolyl, 7-benzimidazolyl, 8-benzimidazolyl), benzoxazolyl (1-benzoxazolyl, 2-benzoxazolyl), benzothiazolyl (1-benzothiazolyl, 2-benzothiazolyl, 4-benzothiazolyl, 5-benzothiazolyl, 6-benzothiazolyl, 7-benzothiazolyl), carbazolyl (1-carbazolyl, 2-carbazolyl, 3-carbazolyl, 4-carbazolyl), 5H-dibenz[b,f]azepine (5H-dibenz[b,f]azepin-1-yl, 5H-dibenz[b,f]azepine-2-yl, 5H-dibenz[b,f]azepine-3-yl, 5H-dibenz[b,f]azepine-4-yl, 5H-dibenz[b,f]azepine-5-yl), 10,11-dihydro-5H-dibenz[b,f]azepine (10,11-dihydro-5H-dibenz[b,f]azepine-1-yl, 10,11-dihydro-5H-dibenz[b,f]azepine-2-yl, 10,11-dihydro-5H-dibenz[b,f]azepine-3-yl, 10,11-dihydro-5H-dibenz[b,f]azepine-4-yl, 10,11-dihydro-5H-dibenz[b,f]azepine-5-yl).

The Functional Entity carries elements used to interact with host molecules and optionally reactive elements allowing further elaboration of an encoded molecule of a library. Interaction with host molecules like enzymes, receptors and polymers is typi-

cally mediated through van der waal's interactions, polar- and ionic interactions and pi-stacking effects. Substituents mediating said effects may be masked by methods known to an individual skilled in the art (Greene, T. W.; Wuts, P. G. M. *Protective Groups in Organic Synthesis*; 3rd ed.; John Wiley & Sons: New York, 1999.) to avoid undesired interactions or reactions during the preparation of the individual building blocks and during library synthesis. Analogously, reactive elements may be masked by suitably selected protection groups. It is appreciated by one skilled in the art that by suitable protection, a functional entity may carry a wide range of substituents.

The Functional Entity Precursor may be masked Functional Entity that is incorporated into an encoded molecule. After incorporation, reactive elements of the Functional Entity may be revealed by un-masking allowing further synthetic operations. Finally, elements mediating recognition of host molecules may be un-masked.

The function of the carrier is to adjust the transferability of the functional entity, playing the role of a leaving group. Substituents on the carrier alter the leaving group efficiency. The stronger the electron withdrawing effect the easier the functional entity is cleaved from the remainder of the building block. However the cleavage can occur too fast which will result in unspecific transfer or hydrolysis. To adjust the transferability a skilled chemist can design suitable substitutions of the carrier by evaluation of initial attempts. The transferability may be adjusted in response to the chemical composition of the functional entity, to the nature of the complementing element, to the conditions under which the transfer and recognition is performed, ect.

According to a preferred embodiment of the invention the carrier is of the general formula:

wherein W, Y, R^2 , and p are as defined above. The transferability of the functional entity can be adjusted by suitable selection of the ring member. When the identity of W are fixed the transferability of the carrier may be adjusted by selecting type, position and amount of the ring substituents R^2 . As an example, an unsubstituted ben-

zene ring ($W = \text{CH}$ for the entire ring structure) may be provided with an increased ability to transfer a functional entity by attaching a Cl in the *ortho* position. The ability to transfer functional entities may also be adjusted by proper selection of one, two or three nitrogen atoms in the ring structure. Finally, the identity and position of Y or alternatively the S-C-connecting group may have an influence of the transferability of the functional entity. Thus, attaching a carbonyl at the *para* position of the ring structure relative to the attachment point of the functional C-F-connecting group confers an increased ability to transfer the functional entity over a position in e.g. the *meta* position.

10

In a preferred aspect of the invention the carrier is

and attaches to the linker through Y and

15

$W = \text{CH}$

$R^2 = -\text{H}$, halogen, $-\text{NO}_2$, $-\text{CN}$, $-\text{C}(\text{Halogen})_3$, $-\text{C}(\text{O})\text{R}^3$, $-\text{C}(\text{O})\text{NHR}^3$, $\text{C}(\text{O})\text{NR}^3_2$, $-\text{S}(\text{O})_2\text{NHR}^3$, $-\text{S}(\text{O})_2\text{NR}^3_2$, $-\text{S}(\text{O})_2\text{R}^3$, $-\text{N}^+\text{R}^3_3$, wherein halogen is selected from the group consisting of $-\text{Cl}$, $-\text{F}$, $-\text{Br}$, and $-\text{I}$, p is an integer of 0 to 3, and $R^3 = \text{H}$, $\text{C}_1\text{-C}_6$ alkyl, or aryl,

20

$Y = \text{absent}$, $\text{C}_1\text{-C}_6$ Alkylene, or carbonyl.

The spacer serves to distance the functional entity to be transferred from the bulky complementing element. Thus, when present, the identity of the spacer is not crucial for the function of the building block. It may be desired to have a spacer which can be cleaved by light. In this occasion, the spacer is provided with e.g. the group

25

30

In the event an increased hydrophilicity is desired the spacer may be provided with a polyethylene glycol part of the general formula:

In a certain aspect of the invention the **Spacer** is a valence bond, C₁-C₆ alkylene-A-, C₁-C₆ alkenylene-A-, C₂-C₆ alkynylene-A-, or

said spacer optionally being connected through A to a linker selected from

- 10 where A is —C(O)NR¹—, —NR¹—, —O—, —S—, or —C(O)—O—; B is —O—, —S—, —NR¹— or —C(O)NR¹— and connects to S-C-connecting group; R¹ is selected independently from H, C₁-C₆ alkyl, C₃-C₇ cycloalkyl, C₁-C₆ alkylene-aryl, or aryl substituted with 0-5 halogen atoms selected from —F, —Cl, —Br and —I; and n and m independently are integers ranging from 1 to 10.

- 15 More preferred the **Spacer** is C₁-C₆ alkylene-A-, C₁-C₆ alkenylene-A-, C₂-C₆ alkynylene-A-, or

said spacer optionally being connected through A to a moiety selected from

- 20 —(CH₂)_n—B—, , and
—(CH₂)_n—S—S—(CH₂)_m—B—
where A is —C(O)NR¹—, or —S—; B is —S—, —NR¹— or —C(O)NR¹— and connects to S-C-connecting group; R¹ is selected independently from H, C₁-C₆ alkyl, C₁-C₆ alkylene-aryl, or aryl; and n and m independently are integers ranging from 1 to 6.

- 25 In certain other aspects of the invention the **Spacer** is —A—, a group C₁-C₆ alkylene-A-, C₂-C₆ alkenylene-A-, or C₂-C₆ alkynylene-A- optionally substituted with 1 to 3 hydroxy groups, or

said spacer being connected through A to a linker selected from

- 5 where A is a valence bond, $-NR^{10}$, $-C(O)NR^{10}$, $-NR^{10}-C(O)-$, $-O-$, $-S-$, $-C(O)-O-$ or $-OP(=O)(O^-)-O-$; B is a valence bond, $-O-$, $-S-$, $-NR^{10}$, $-C(O)-$ or $-C(O)NR^{10}$ and connects to S-C-connecting group; R^{10} is selected independently from H, C_1-C_6 al-

kyl, C_3-C_7 cycloalkyl, aryl, C_1-C_6 alkylene-aryl, ; G is H or C_1-C_6 alkyl; and n and m independently are integers ranging from 1 to 10.

10

In a preferred aspect of the invention, the **spacer** is C_2-C_6 alkenylene-A, said spacer being connected through A to a moiety selected from

- 15 where A is a valence bond, $-C(O)NR^{10}$, $-NR^{10}-C(O)-$, $-S-$, $-C(O)-O-$ or $-OP(=O)(O^-)-O-$; B is a valence bond, $-S-$, $-NR^{10}$, or $-C(O)-$ and connects to S-C-connecting group; n and m independently are integers ranging from 1 to 10 and

R^{10} is selected independently from H, wherein G is H or C_1-C_6 alkyl; and the spacer is connected to the complementing element through a nucleobase.

20

Usually, the spacer connects to the 5 position of a pyrimidine or the 7 position of a purine or deaza-purine. However, other attachment point on the nucleobase may be contemplated.

- 25 In another preferred aspect the spacer connects to the back bone of the complementing element. In this case the **spacer** is $-A-$,

said spacer being connected through A to a moiety selected from

where A is a valence bond, $-\text{NR}^{10}-\text{C}(\text{O})-$, $-\text{O}-$, or $-\text{S}-$; B is a valence bond, $-\text{S}-$,

5 $-\text{NR}^{10}-$, or $-\text{C}(\text{O})-$ and connects to S-C-connecting group;

n and m independently are integers ranging from 1 to 10 and

R^{10} is selected independently from H,  or , wherein G is H or C_1-C_6 alkyl; and the spacer is connected to the complementing element via a phosphorus group.

10

The phosphorus group is preferably a phosphate or a thiophosphate group attached to a 3' or a 5' end of a complementing element.

15

In a preferred embodiment, the complementing element serves the function of transferring genetic information e.g. by recognising a coding element. The recognition implies that the two parts are capable of interacting in order to assemble a complementing element – coding element complex. In the biotechnological field a variety of interacting molecular parts are known which can be used according to the invention. Examples include, but are not restricted to protein-protein interactions, protein-polysaccharide interactions, RNA-protein interactions, DNA-DNA interactions, DNA-RNA interactions, RNA-RNA interactions, biotin-streptavidin interactions, enzyme-ligand interactions, antibody-ligand interaction, protein-ligand interaction, ect.

20

25

The interaction between the complementing element and coding element may result in a strong or a weak bonding. If a covalent bond is formed between the parties of the affinity pair the binding between the parts can be regarded as strong, whereas the establishment of hydrogen bondings, interactions between hydrophobic domains, and metal chelation in general results in weaker bonding. In general relatively weak bonding is preferred. In a preferred aspect of the invention, the complementing element is capable of reversible interacting with the coding element so as to

30

provide for an attachment or detachment of the parts in accordance with the changing conditions of the media.

5 In a preferred aspect of the invention, the interaction is based on nucleotides, i.e. the complementing element is a nucleic acid. Preferably, the complementing element is a sequence of nucleotides and the coding element is a sequence of nucleotides capable of hybridising to the complementing element. The sequence of nucleotides carries a series of nucleobases on a backbone. The nucleobases may be any chemical entity able to be specifically recognized by a complementing entity. The
10 nucleobases are usually selected from the natural nucleobases (adenine, guanine, uracil, thymine, and cytosine) but also the other nucleobases obeying the Watson-Crick hydrogen-bonding rules may be used, such as the synthetic nucleobases disclosed in US 6,037,120. Examples of natural and non-natural nucleobases able to perform a specific pairing are shown in Figure 2. The backbone of the sequence of
15 nucleotides may be any backbone able to aggregate the nucleobases is a sequence. Examples of backbones are shown in figure 4. In some aspects of the invention the addition of non-specific nucleobases to the complementing element is advantageous, figure 3.

20 The coding element can be an oligonucleotide having nucleobases which complement and is specifically recognised by the complementing element, i.e. in the event the complementing element contains cytosine, the coding element part contains guanine and visa versa, and in the event the complementing element contains thymine or uracil the coding element contains adenine.

25 The complementing element may be a single nucleobase. In the generation of a library, this will allow for the incorporation of four different functional entities into the template-directed molecule. However, to obtain a higher diversity a complementing element preferably comprises at least two and more preferred at least three nucleotides. Theoretically, this will provide for 4^2 and 4^3 , respectively, different functional
30 entities uniquely identified by the complementing element. The complementing element will usually not comprise more than 100 nucleotides. It is preferred to have complementing elements with a sequence of 3 to 30 nucleotides.

The spacer part of the linker is attached to the carrier through a S-C-connecting group (short for Spacer-Carrier-connecting group). The S-C-connecting may have
35 any chemical composition which provides for an attachment of the Spacer with the

carrier. In certain aspect of the invention the **S-C-connecting group** is a valence bond, $-\text{NH}-\text{C}(=\text{O})-$, $-\text{NH}-\text{C}(=\text{O})-\text{C}_1-\text{C}_6$ alkylene-, $-\text{S}-\text{S}-$, $-\text{S}-\text{S}-\text{C}_1-\text{C}_6$ alkylene-, $-\text{C}_1-\text{C}_6$

5

$-\text{NH}-\text{C}(=\text{O})-\text{Arylene}-\text{C}(\text{R}^{10})_2-\text{NH}-\text{C}(=\text{O})-$, $-\text{C}(=\text{O})-$, $-\text{C}(=\text{O})-\text{C}_1-\text{C}_6$ alkylene- or $-\text{C}(=\text{O})-\text{Arylene}-\text{C}(\text{R}^{10})_2-\text{NR}^{10}-\text{C}(=\text{O})-$, where the right hand side of the formulae connects to the carrier.

- 10 In a preferred aspect the **S-C-connecting group** is $-\text{S}-\text{S}-$, $-\text{C}_1-\text{C}_6$ alkylene- $\text{S}-\text{S}-$, $-\text{C}(=\text{O})-\text{NH}-(\text{C}_1-\text{C}_6 \text{ alkylene})-$, $-\text{C}(=\text{O})-$, or $-\text{C}(=\text{O})-\text{Arylene}-\text{C}(\text{R}^{10})_2-\text{NR}^{10}-\text{C}(=\text{O})-$, where the right hand side of the formulae connects to the carrier.

In a still more preferred aspect the **S-C-connecting group** is a valence bond, $-\text{NH}-\text{C}(=\text{O})-$, $-\text{S}-\text{S}-$, or $-\text{C}(=\text{O})-\text{NH}-$, where the right hand side of the formulae connects to the carrier.

15

The building blocks of the present invention can be used in a method for transferring a functional entity to a recipient reactive group, said method comprising the steps of providing one or more building blocks as described above and

- 20 contacting the one or more building blocks with a corresponding encoding element associated with a recipient reactive group under conditions which allow for a recognition between the one or more complementing elements and the encoding elements, said contacting being performed prior to, simultaneously with, or subsequent to a transfer of the functional entity to the recipient reactive group.

25

The encoding element may comprise one, two, three or more codons, i.e. sequences that may be specifically recognised by a complementing element. Each of

the codons may be separated by a suitable spacer group. Preferably, all or at least a majority of the codons of the template are arranged in sequence and each of the codons are separated from a neighbouring codon by a spacer group. Generally, it is preferred to have more than two codons on the template to allow for the synthesis of more complex encoded molecules. In a preferred aspect of the invention the number of codons of the encoding element is 2 to 100. Still more preferred are encoding elements comprising 3 to 10 codons. In another aspect, a codon comprises 1 to 50 nucleotides and the complementing element comprises a sequence of nucleotides complementary to one or more of the encoding sequences.

10

The recipient reactive group may be associated with the encoding element in any appropriate way. Thus, the reactive group may be associated covalently or non-covalently to the encoding element. In one embodiment the recipient reactive group is linked covalently to the encoding element through a suitable linker which may be separately cleavable to release the reaction product. In another embodiment, the reactive group is coupled to a complementing element, which is capable of recognising a sequence of nucleotides on the encoding element, whereby the recipient reactive group becomes attached to the encoding element by hybridisation. Also, the recipient reactive group may be part of a chemical scaffold, i.e. a chemical entity having one or more reactive groups available for receiving a functional entity from a building block.

15

The recipient reactive group may be any group able to cleave the C-F-connecting group to release the functional entity. Usually, the reactive group is nucleophilic, such as a hydroxyl, a thiol, an amine ect. A preferred recipient reactive group is an amine group. The nucleophile usually attacks the C-F-connecting group between Z and X=V or between the carrier and X=V, thereby causing the carrier group with an optional Z group to be the leaving group of the reaction and transferring the X(=V)-Functional entity precursor to the recipient. The chemical structure formed has, in the event the nucleophilic group is an amine attached to a scaffold, the general formula:

25

30

Scaffold-NH-X(=V)-Functional entity precursor

35

In which

X = -C-, -S-, -P-, -S(O)-, -P(O)-, and

V = O, S, NH, N-C₁-C₆ alkyl.

In a preferred aspect X is -C- and V is O.

5

The conditions which allow for transfer to occur are dependent upon the building block, notable the carrier and the C-F-connecting group, as well as the receiving reactive group. Below various examples of the conditions for a transfer to occur are depicted together with the reaction product formed.

J. Hydantoin formation by reaction of Urea and α -substituted Esters

According to a preferred aspect of the invention the building blocks are used for the formation of a library of compounds. The complementing element of the building block is used to identify the functional entity. Due to the enhanced proximity between reactive groups when the complementing entity and the encoding element are contacted, the functional entity together with the identity programmed in the complementing element is transferred to the encoding element associated with recipient reactive group. Thus, it is preferred that the sequence of the complementing element is unique in the sense that the same sequence is not used for another functional entity. The unique identification of the functional entity enable the possibility of decoding the encoding element in order to determine the synthetic history of the molecule formed. In the event two or more functional entities have been transferred to a scaffold, not only the identity of the transferred functional entities can be determined. Also the sequence of reaction and the type of reaction involved can be determined by decoding the encoding element. Thus, according to a preferred embodiment of the invention, each different member of a library comprises a complementing element having a unique sequence of nucleotides, which identifies the functional entity.

Detailed Description of the Invention

A building block of the present invention is characterized by its ability to transfer its functional entity to a receiving chemical entity. This is done by forming a new covalent bond between the receiving chemical entity and cleaving the bond between the carrier moiety and the functional entity of the building block.

Two setups for generalized functional entity transfer from a building block are depicted in figure 1. In the first example, one complementing element of a building block recognizes a template carrying another functional entity, hence bringing the functional entities in close proximity. This results in a reaction between functional entity precursor 1 and 2 forming a covalent bond between these concurrent with the cleavage of the bond between functional entity precursor 2 and its linker. In the second example, a template brings together two building blocks resulting in functional entity transfer from one building block to the other.

Fig. 6 discloses three examples of building blocks. For illustrative purposes the individual features used in the claims are indicated. In the upper compound the spacer part of the linker connects to a 3'-phosphate group of an oligonucleotide. The first part of the linker, i.e. the spacer, is an aliphatic chain ending in a nitrogen atom. The nitrogen atom bridges to the S-C-connecting group, which is an N-acylated aryl-methyleamine. The carrier attached to the left hand side carbonyl group of the S-C-connecting group is a nitrophenyl group. In the para position of the nitrophenyl group, the C-F-connecting group is attached. When the building block is presented to a nucleophilic group, the functional entity precursor and the carbonyl group of the C-F-connecting group is transferred. In the event the nucleophilic group is an amine, the bond formed is an amide bond.

The middle compound of Fig. 6 discloses a linker attached to the 5' position of an oligonucleotide. The linker is attached through a 5' phosphate group and extends into a short 3 member aliphatic chain to another phosphate group which is connected to a linker terminal nitrogen group via a PEG part. The linker nitrogen group is connected to the carrier via a carbonyl group. The carrier is of the thiophenyl type as the sulphur of the C-F-connecting group connects to the ring structure. When the building block is presented to a nucleophilic group, such as an amine, the functional entity precursor together with the carbonyl group of the C-F-connecting group is

transferred to said recipient group forming an amide bond when the nucleophile is an amine.

5 The lower compound shown on Fig. 6 illustrates an example of the linker being connected to the nucleobase of the oligonucleotide complementing element. More specifically, the linker connects to the 5 position of a pyrimidine. The linker extends through an $\alpha - \beta$ unsaturated N-methylated amide to the S-C-connecting group, which is a 4-amino methyl benzoic acid derivative. The carrier is of the phenol type and the functional entity precursor together with the thiocarbonyl group of the C-F-
10 connecting group may be transferred to a recipient reactive group forming an amide in the event the recipient reactive group is an amine.

15 In a library synthesis, several building blocks are mixed in a reaction vessel and the added templates ensure that the building blocks - consequently the functional entities - are combined in the desired manner. As several building blocks are employed at the same time, the use of *in situ* generated building blocks is disfavoured for practical reasons.

20 Building blocks for library synthesis should possess the necessary reactivity to enable the transfer of the functional entity but should also be stable enough to endure storage and the conditions applied during library synthesis. Hence fine tuning of the reactivity for a particular building block is vital. The reactivity of a building block depends partly on the characteristics of the functional entity and the characteristics of the carrier. E.g. a highly reactive functional entity attached to a highly reactive carrier would form a building block that may be susceptible to hydrolysis during the library synthesis thus preventing successful transfer of one functional entity to another. Further, if transfer of a functional entity precursor is faster than coding element - complementing element recognition unspecific reactions may result.
25 Therefore, the present invention particularly relates to practically useful library building blocks capable of acting as acylating agents, thioacetylating agents or amidinoylating agents with a balanced reactivity. Such building blocks may be assembled by several different pathways as described below.

Experiments

25 General Procedure 1: Synthesis of benzoic acid derivatives for building blocks:

The benzoic acid derivative (1 mmol) was dissolved in THF (5 mL) and pyridine (3 mmol). The mixture was cooled to $0^{\circ}C$ and treated with an acid chloride (1.2 mmol).

30 The cooling bath was removed and the reaction mixture was stirred for 1 hour at rt. Toluene (10 mL) was added and the solution was evaporated *in vacuo*. The crude

was redissolved in EtOAc (10 mL), washed with water and brine. The organic phase was dried over MgSO_4 and evaporated *in vacuo*. The pure product was obtained by silica gel purification using a gradient of heptane to EtOAc as eluent.

General Procedure 2: Synthesis of nicotinic acid derivative for building blocks:

5 The nicotinic acid derivative (6.44 mmol) was dissolved in THF (10 mL) and triethyl-
amine (5 mL). The mixture was cooled to 0°C and treated with an acid chloride
(12.88 mmol). The cooling bath was removed and the reaction mixture was stirred
overnight at rt. After removal of the solvents, toluene (10 mL) was added to the
crude and evaporated *in vacuo*. The pure product was obtained by silica gel purifica-
10 tion using a gradient starting from dichloromethane going to 2% methanol in di-
chloromethane as eluent.

Example 6 (General procedure 2, wherein Z=S, R'=H, and R= CH₃)

2-Acetylsulfanyl-nicotinic acid

15 Yield = 5%: ¹H-NMR (CDCl₃): 8.76 (dd, 1H); 8.64 (dd, 1H); 7.40 (dd, 1H); 2.79 (s,
3H).

General Procedure 3: Preparation of building blocks by loading a Carrier-Functional entity ensemble onto an oligonucleotide comprising an amino group:

25 μ L of a 150 mM benzoic acid derivative in DMF was mixed with 25 μ L of a 150 mM solution of EDC in DMF. The mixture was left for 30 min at 25°C. 50 μ L of an aminooligo (10 nmol) in 100 mM HEPES buffer pH 7.5 was added and the reaction mixture was left for 20 min at 25°C. The excess building block was removed by ex-
 5 traction with EtOAc (500 μ L) and remaining EtOAc was removed *in vacuo* by spinning 10 min in a speedvac. The aminooligo loaded with the benzoic acid derivative was ethanol precipitated twice using NH_4OAc and analysed by electron spray mass spectrometry (ES-MS).

Example 14: Loading of a trisamine scaffold on an oligonucleotide containing a nucleotide derivative comprising an amino group:

20 A hexameric scaffold peptide with the sequence, CysPhePheLysLysLys, was synthesised by standard solid-phase Fmoc peptide chemistry. The scaffold peptide comprises a -SH group on the cystein side chain, said -SH group being used for coupling the scaffold peptide to a amine-bearing oligonucleotide serving as anti-codon and linker. Each of the three lysin moieties comprises an amino group in the side chain. The amine groups are used as reactive groups for the formation of a connection to functional entities emanating from building blocks.

25 The N-terminus of the peptide was acetylated and the C-terminus was initially capped as an amide to avoid any participation in the reactions to follow and subsequently purified by reverse phase-HPLC. The scaffold peptide was covalently attached to DNA oligonucleotide using the scheme shown schematically below. For illustrative purposes, the scaffold is indicated as HS—Scaffold

- 5 nmol of oligodeoxynucleotide F: 5'-XTCGTAACGACTGAATGACGT where X = 5' amino C6 (Glen# 10-1906-90) in 100 mM Hepes-OH pH 7.5 is incubated with 20 mM Succinimidyl-propyl-2-dithiopyridyl (SPDP, Molecular probes) dissolved in DMSO for 3 hours at 25 °C. Excess SPDP is removed by triple extraction using 5 volumes of ethylacetate. The sample is further purified using a Bio-rad Microspin 6 column equilibrated in H₂O.
- The oligonucleotide-scaffold conjugate is synthesised by incubating 1 µmol hexapeptide with 5 nmol SPDP activated oligonucleotide in 100 mM Hepes-OH pH 7.5 for 2 hours at 25 °C. Excess peptide is removed by double sodium-acetate/ethanol precipitation of the scaffold-DNA complex according to standard procedure. The loading was verified by Electrospray Mass Spectrometry (ES-MS).

Example 15: Transfer of a functional entity from a building block to a scaffold:

- A template oligo G: 5'-ACGTCATTTCAGTCGTTACGAACGATGGATGCTCCAGG TCGC (1 nmol) was mixed with scaffold oligo F (1.5 nmol) in MES-buffer (20 µL of a 100 mM MES, pH=6) and water (added to a final volume of 100 µL). Scaffold oligo F was annealed to the template by heating to 80 °C and cooled (-2 °C/ 10 second) to room temperature and functional entity oligo E (Example 11) (1.5 nmol) was added. The mixture was left o/n at room temperature. The oligo complex was attached to

streptavidine by addition of streptavidine sepharose beads (50 μ L, prewashed with 2x1 mL 100 mM MES buffer, pH=6). The beads were washed with water (4 x 200 μ L). Oligo F was separated from the streptavidine bound complex by addition of water (200 μ L) followed by heating to 80 °C for 5 minute. The beads were filtered off and the water was evaporated. Oligo F was redissolved in water and building block transfer verified by electron spray mass spectrometry (ES-MS).

Transfer of acetyl to trisamine scaffold oligo F from example I attached to oligo E:

Section 3: Transfer efficiencies of functional entities from building blocks to amine scaffolds

Carrier coupled functional entities were loaded onto oligos (oligonucleotides) containing a nucleotide derivative comprising an amino group (General procedure 5) or a nucleotide derivative comprising a thiol (General procedure 6) and the transfer was conducted to a scaffold oligo with a nucleotide derivative comprising an amino group. Transfer efficiencies were analyzed by ES-MS (electrospray mass spectroscopy) (General procedure 7).

General Procedure 5: Loading of a carrier coupled functional entity onto an amino oligo:

25 μ L 100 mM carrier coupled functional entity dissolved in DMF (dimethyl formamide) was mixed with 25 μ L 100 mM EDC (1-ethyl-3-(3-dimethylaminopropyl) carbodiimide hydrochloride) in DMF for 30 minutes at 25° C. The mixture was added to 50 μ L amino oligo in H₂O with 100 mM HEPES (2-[4-(2-hydroxy-ethyl)-piperazin-1-yl]-ethanesulfonic acid) pH 7.5 and the reaction was allowed to proceed for 20 minutes at 25° C. Unreacted carrier coupled functional entity was removed by extraction with 500 μ L EtOAc (ethyl acetate), and the oligo was purified by gel filtration through a microspin column equilibrated with 100 mM MES (2-(N-morpholino) ethanesulfonic acid) pH 6.0.

General Procedure 6: Loading of a carrier coupled functional entity onto a thiol oligo:

5 10 nmol thiol oligo was lyophilized and redissolved in 50 μ l H₂O with 100 mM dithiothreitol and 100 mM sodium phosphate pH 8.0 and incubated at 37 °C for 1 hour. The reduced oligo was purified using a microspin column equilibrated with HEPES (100 mM, pH 7.5). Then 100 mM NHM (N-hydroxymaleimide) in HEPES (100 mM, pH 7.5) was added to the thiol oligo and the mixture was incubated at 25°C for 2
10 hours. The resulting NHS (N-hydroxysuccinimide)-oligo was purified using a microspin column equilibrated with H₂O. 1 nmol NHS-oligo was lyophilized and redissolved in 10 μ l 100 mM MES, pH 6. 50 μ l carrier coupled functional entity (100 mM) in dimethyl formamide was activated with 50 μ l 100 mM EDC in DMF for 30 min at 25 °C. 10 μ l of the EDC-activated carrier coupled functional entity was mixed with
15 the NHS-oligo and incubated for 5 min at 25 °C. 30 μ l 100 mM MES pH 6 was added and following an extraction with 500 μ l EtOAc the oligo was purified using a microspin column equilibrated with 100 mM MES pH6.

Example 21: Stability of building block oligonucleotides during storage and handling

- 10 Carrier coupled functional entities were loaded onto oligonucleotides containing a nucleotide derivative comprising an amino group (General Procedure 7). The resulting carrier coupled functional entity oligos were either mixed immediately with scaffold oligo I at 25°C (condition 1) or subjected to different conditions before mixing: (condition 2) -80°C for 14 days, (condition 3) 25°C for 1 hour. For condition 4
- 15 the scaffold oligo and the building block oligo were heated to 80°C for 30 seconds, mixed, and then cooled to 25°C (-5°C / minute). The functional entity of the building block oligo was transferred to a scaffold oligo by incubation at 25°C overnight and analyzed by ES-MS (General procedure 3).
- 20 Transfer efficiencies (in percent) in reactions involving the same building block were normalized to facilitate comparison, e.g. the observed transfer efficiency when scaffold oligo was mixed with building block oligo immediately after production was set to 100:

Condition	Description	Ex. 16	Ex. 17	Ex. 18	Ex. 19
1	Immediate mixing	100	100	100	100
2	-80°C for 14 days	96	97	89	92
3	25°C for 1 hour	97	98	93	71
4	From 80°C to 25°C	106	105	87	60 ⁵

10 The results indicate that all the building blocks may be stored in a freezer at -80°C
for several weeks without losing significant reactivity. Under practical handling
conditions at room temperature the NHS ester of example 19, which is not according
to the invention, loses a considerable amount of reactivity. The tendency of spon-
taneous hydrolysis of the building block according to example 18 is reinforced under
the condition simulating an actual experiment (condition 4), while the building blocks
15 of example 16 to 18 have an acceptable stability or even a slightly increased activity.
Activities above 100 observed under condition 4 might be due to experimental varia-
tion or facilitation of annealing of the carrier coupled functional entity oligo and scaf-
fold oligo at elevated temperatures.

Claims

1. A building block of the general formula

5 **Complementing Element – Linker – Carrier – C-F-connecting group – Functional entity precursor**

capable of transferring a functional entity to a recipient reactive group, wherein

Complementing Element is a group identifying the functional entity precursor,

10 **Linker** is a chemical moiety comprising a **Spacer** and a **S-C-connecting group**, wherein the **Spacer** is a valence bond or a group distancing the functional entity precursor to be transferred from the complementing element and the S-C-connecting group connects the spacer with the Carrier,

Carrier is selected among the groups

wherein the Linker attaches to the Carrier through Y and

W = CH or N

20 $R^2 = -H, -\text{Halogen}, -\text{NO}_2, -\text{CN}, -\text{C}(\text{Halogen})_3, -\text{C}(\text{O})\text{R}^3, -\text{C}(\text{O})\text{NHR}^3, \text{C}(\text{O})\text{NR}^3_2, -\text{NC}(\text{O})\text{R}^3, -\text{S}(\text{O})_2\text{NHR}^3, -\text{S}(\text{O})_2\text{NR}^3_2, -\text{S}(\text{O})_2\text{R}^3, -\text{P}(\text{O})_2\text{R}^3, -\text{P}(\text{O})-\text{R}^3, -\text{S}(\text{O})-\text{R}^3, \text{P}(\text{O})-\text{OR}^3, -\text{S}(\text{O})-\text{OR}^3, -\text{N}^+\text{R}^3_3$, wherein p is an integer of 0 to 3, $R^3 = \text{H}, \text{C}_1\text{-C}_6 \text{ alkyl}, \text{C}_1\text{-C}_6 \text{ alkenyl}, \text{C}_1\text{-C}_6 \text{ alkynyl}, \text{or aryl}$, and Halogen is F, Cl, Br, or I,

X = -C-, -S-, -P-, -S(O)- or -P(O)-,

V = O, S, NH, or N-C₁-C₈ alkyl, and

Z = O, S; and

30 **Functional entity precursor** is H or selected among the group consisting of a $\text{C}_1\text{-C}_6 \text{ alkyl}, \text{C}_2\text{-C}_6 \text{ alkenyl}, \text{C}_2\text{-C}_6 \text{ alkynyl}, \text{C}_4\text{-C}_8 \text{ alkadienyl}, \text{C}_3\text{-C}_7 \text{ cycloalkyl}, \text{C}_3\text{-C}_7 \text{ cycloheteroalkyl}, \text{aryl}, \text{and heteroaryl}$, said group being substituted with 0-3 R^4 , 0-3

R^5 and 0-3 R^9 , or selected among the group consisting of C_1 - C_3 alkylene- NR^4_2 , C_1 - C_3 alkylene- $NR^4C(O)R^8$, C_1 - C_3 alkylene- $NR^4C(O)OR^8$, C_1 - C_2 alkylene- $O-NR^4_2$, C_1 - C_2 alkylene- $O-NR^4C(O)R^8$, and C_1 - C_2 alkylene- $O-NR^4C(O)OR^8$ substituted with 0-3 R^9 .

where R^4 is H or selected independently among the group consisting of C_1 - C_6 alkyl, C_2 - C_6 alkenyl, C_2 - C_6 alkynyl, C_3 - C_7 cycloalkyl, C_3 - C_7 cycloheteroalkyl, aryl, heteroaryl, said group being substituted with 0-3 R^9 and

R^5 is selected independently from $-N_3$, $-CNO$, $-C(NOH)NH_2$, $-NHOH$, $-NHNHR^6$, $-C(O)R^6$, $-SnR^6_3$, $-B(OR^6)_2$, $-P(O)(OR^6)_2$ or the group consisting of C_2 - C_6 alkenyl, C_2 - C_6 alkynyl, C_4 - C_8 alkadienyl said group being substituted with 0-2 R^7 ,

where R^6 is selected independently from H, C_1 - C_6 alkyl, C_3 - C_7 cycloalkyl, aryl or C_1 - C_6 alkylene-aryl substituted with 0-5 halogen atoms selected from $-F$, $-Cl$, $-Br$, and $-I$; and R^7 is independently selected from $-NO_2$, $-COOR^6$, $-COR^6$, $-CN$, $-OSiR^6_3$, $-OR^6$ and $-NR^6_2$.

R^8 is H, C_1 - C_6 alkyl, C_2 - C_6 alkenyl, C_2 - C_6 alkynyl, C_3 - C_7 cycloalkyl, aryl or C_1 - C_6 alkylene-aryl substituted with 0-3 substituents independently selected from $-F$, $-Cl$, $-NO_2$, $-R^3$, $-OR^3$, $-SiR^3_3$

R^9 is $=O$, $-F$, $-Cl$, $-Br$, $-I$, $-CN$, $-NO_2$, $-OR^6$, $-NR^6_2$, $-NR^6C(O)R^8$, $-NR^6C(O)OR^8$, $-SR^6$, $-S(O)R^6$, $-S(O)_2R^6$, $-COOR^6$, $-C(O)NR^6_2$ and $-S(O)_2NR^6_2$.

2. The compound according to claim 1, wherein the **Spacer** is a valence bond, C_1 - C_6 alkylene-A-, C_1 - C_6 alkenylene-A-, C_2 - C_6 alkynylene-A-, or

said spacer optionally being connected through A to a linker selected from

— $(CH_2)_n$ —S—S— $(CH_2)_m$ —B—

where A is $-C(O)NR^1$ -, $-NR^1$ -, $-O$ -, $-S$ -, or $-C(O)-O$ -; B is $-O$ -, $-S$ -, $-NR^1$ - or $-C(O)NR^1$ - and connects to S-C-connecting group; R^1 is selected independently from

H, C_1 - C_6 alkyl, C_3 - C_7 cycloalkyl, C_1 - C_6 alkylene-aryl, or aryl substituted with 0-5 halogen atoms selected from $-F$, $-Cl$, $-Br$ and $-I$; and n and m independently are integers

ranging from 1 to 10.

3. The compound according to claim 1, wherein the **Spacer** is C₁-C₆ alkylene-A-, C₁-C₆ alkenylene-A-, C₂-C₆ alkynylene-A-, or

said spacer optionally being connected through A to a moiety selected from

where A is $-C(O)NR^1$ -, or $-S$ -; B is $-S$ -, $-NR^1$ - or $-C(O)NR^1$ - and connects to $S-C$ -connecting group; R^1 is selected independently from H, C_1 - C_6 alkyl, C_1 - C_6 alkylene-aryl, or aryl; and n and m independently are integers ranging from 1 to 6.

10

4. The compound according to claim 1, wherein **Spacer** is -A-, a group C₁-C₆ alkylene-A-, C₂-C₆ alkenylene-A-, or C₂-C₆ alkynylene-A- optionally substituted with 1 to 3 hydroxy groups, or

15 said spacer being connected through A to a linker selected from

where A is a valence bond, $-\text{NR}^{10}$, $-\text{C}(\text{O})\text{NR}^{10}$, $-\text{NR}^{10}-\text{C}(\text{O})-$, $-\text{O}-$, $-\text{S}-$, $-\text{C}(\text{O})-\text{O}-$ or $-\text{OP}(=\text{O})(\text{O}^-)-\text{O}-$; B is a valence bond, $-\text{O}-$, $-\text{S}-$, $-\text{NR}^{10}$, $-\text{C}(\text{O})-$ or $-\text{C}(\text{O})\text{NR}^{10}$ - and connects to S-C-connecting group; R^{10} is selected independently from H, C_1 - C_6 al-

20

kyl, C₃-C₇ cycloalkyl, aryl, C₁-C₆ alkylene-aryl,  or ; G is H or C₁-C₆ alkyl; and n and m independently are integers ranging from 1 to 10.

5. A compound according to claim 4, wherein the **spacer** is C₂-C₆ alkenylene-A,
25 said spacer being connected through A to a moiety selected from

where A is a valence bond, $-\text{C}(\text{O})\text{NR}^{10}-$, $-\text{NR}^{10}-\text{C}(\text{O})-$, $-\text{S}-$, $-\text{C}(\text{O})-\text{O}-$ or $-\text{OP}(=\text{O})(\text{O}^-)-\text{O}-$; B is a valence bond, $-\text{S}-$, $-\text{NR}^{10}-$, or $-\text{C}(\text{O})-$ and connects to S-C-connecting group; n and m independently are integers ranging from 1 to 10 and

- 5 R^{10} is selected independently from H, $(\text{CH}_2)_n\text{O}-\text{G}$ or $(\text{CH}_2)_n\text{N}(\text{G})_2$, wherein G is H or C_1-C_6 alkyl; and the spacer is connected to the complementing element through a nucleobase.

6. A compound according to claim 4, wherein the spacer is -A-,

said spacer being connected through A to a moiety selected from

where A is a valence bond, $-\text{NR}^{10}-\text{C}(\text{O})-$, $-\text{O}-$, or $-\text{S}-$; B is a valence bond, $-\text{S}-$, $-\text{NR}^{10}-$, or $-\text{C}(\text{O})-$ and connects to S-C-connecting group; n and m independently are integers ranging from 1 to 10 and

- 15 R^{10} is selected independently from H, $(\text{CH}_2)_n\text{O}-\text{G}$ or $(\text{CH}_2)_n\text{N}(\text{G})_2$, wherein G is H or C_1-C_6 alkyl; and the spacer is connected to the complementing element via a phosphorus group.

20 7. A compound according to claim 6, wherein the phosphorus group is a phosphate or thiophosphate group attached to a 3' or 5' end of a complementing element.

8. A compound according to claims 1 to 7, wherein the S-C-connecting group is a valence bond, $-\text{NH}-\text{C}(=\text{O})-$, $-\text{NH}-\text{C}(=\text{O})-\text{C}_1-\text{C}_6$ alkylene-, $-\text{S}-\text{S}-$, $-\text{S}-\text{S}-\text{C}_1-\text{C}_6$ alkylene-, $-\text{C}_1-\text{C}_6$ alkylene- $\text{S}-\text{S}-$, $-\text{C}(=\text{O})-\text{NH}-(\text{C}_1-\text{C}_6$ alkylene)-,

—NH-C(=O)-Arylene-C(R¹⁰)₂-NH-C(=O)-, -C(=O)-, -C(=O)-C₁-C₆ alkylene- or -C(=O)-Arylene-C(R¹⁰)₂-NR¹⁰-C(=O)-, where the right hand side of the formulae connects to the carrier.

5

9. A compound according to claims 1 to 8, wherein the **S-C-connecting group** is a valence bond, —NH-C(=O)-, —NH-C(=O)-C₁-C₆ alkylene-, —S-S-, —S-S-C₁-C₆ alkylene-, —C(=O)-NH-(C₁-C₆ alkylene)-,

10

—NH-C(=O)-Arylene-C(R¹⁰)₂-NH-C(=O)-, where the right hand side of the formulae connects to the carrier.

10. A compound according to claims 1 to 9, wherein the **S-C-connecting group** is —S-S-, —C₁-C₆ alkylene-S-S-, —C(=O)-NH-(C₁-C₆ alkylene)-, —C(=O)-, or —C(=O)-Arylene-C(R¹⁰)₂-NR¹⁰-C(=O)-, where the right hand side of the formulae connects to the carrier.

11. A compound according to claims 1 to 10, wherein the **S-C-connecting group** is —S-S-, —C(=O)-, or —C(=O)-Arylene-C(R¹⁰)₂-NR¹⁰-C(=O)-, where the right hand side of the formulae connects to the carrier.

12. The compound according to any of the claims 1 to 11, wherein the **S-C-connecting group** is a valence bond, —NH-C(=O)-, —S-S-, or —C(=O)-NH-, where the right hand side of the formulae connects to the carrier.

13. A compound according to claims 1 to 12, wherein the carrier is

and attaches to the linker through Y, and W, Y, R², and p are as defined in claim 1.

14. A compound according to claims 1 to 13, wherein the carrier is

5

and attaches to the linker through Y and

W = CH

- 10 R² = -H, halogen, -NO₂, -CN, -C(Halogen)₃, -C(O)R³, -C(O)NHR³, C(O)NR³₂,
-S(O)₂NHR³, -S(O)₂NR³₂, -S(O)₂R³, -N⁺R³₃, wherein halogen is selected from the
group consisting of -Cl, -F, -Br, and -I, p is an integer of 0 to 3, and R³ = H, C₁-C₆
alkyl, or aryl,
Y = absent, C₁-C₆ Alkylene, or carbonyl.

- 15 15. A compound according to any of the claims 1 to 14, wherein the C-F-connecting

group is $\text{---Z---}\overset{\text{V}}{\underset{\text{X}}{\text{C}}}$, in which

Z = O, S

X = -C-, and

V = O.

20

16. A compound according to any of the claims 1 to 15, wherein Complementing
element is a nucleic acid.

- 25 17. A compound according to any of the claims 1 to 16, wherein Complementing
element is a sequence of nucleotides selected from the group of DNA, RNA, LNA
PNA, morpholino derivatives, or combinations thereof.

- 30 18. A compound according to any of the claims 1 to 17, wherein the **Functional
entity precursor** is H or selected among the group consisting of a C₁-C₆ alkyl,
C₂-C₆ alkenyl, C₂-C₆ alkynyl, C₄-C₈ alkadienyl, C₃-C₇ cycloalkyl, C₃-C₇ cycloheteroal-

kyl, aryl, and heteroaryl, said group being substituted with 0-3 R⁵ and 0-3 R⁹, or selected among the group consisting of C₁-C₃ alkylene-NR⁴₂, C₁-C₃ alkylene-NR⁴C(O)R⁸, C₁-C₃ alkylene-NR⁴C(O)OR⁸, C₁-C₂ alkylene-O-NR⁴₂, C₁-C₂ alkylene-O-NR⁴C(O)R⁸, and C₁-C₂ alkylene-O-NR⁴C(O)OR⁸ substituted with 0-3 R⁹.

5

19. A compound according to claims 1 to 18, wherein the **Functional entity precursor** is H or selected among the group consisting of C₁-C₆ alkyl, C₂-C₆ alkenyl, C₂-C₆ alkynyl, C₄-C₈ alkadienyl, C₃-C₇ cycloalkyl, C₃-C₇ cycloheteroalkyl, aryl, and heteroaryl, said group being substituted with 0-3 R⁵ and 0-3 R⁹.

10

20. A compound according to any of the claims 1 to 19, wherein **Functional entity precursor** is selected among the group consisting of C₁-C₃ alkylene-NR⁴₂, C₁-C₃ alkylene-NR⁴C(O)R⁸, C₁-C₃ alkylene-NR⁴C(O)OR⁸, C₁-C₂ alkylene-O-NR⁴₂, C₁-C₂ alkylene-O-NR⁴C(O)R⁸, and C₁-C₂ alkylene-O-NR⁴C(O)OR⁸ substituted with 0-3 R⁹.

15

21. A library of compounds according to any of the claims 1 to 20, wherein each different member of the library comprises a complementing element having a unique sequence of nucleotides, which identifies the functional entity.

20

22. A method for transferring a functional entity to a recipient reactive group, comprising the steps of

providing one or more building blocks according to any of the claims 1 to 20,

contacting the one or more building blocks with a corresponding encoding element associated with a recipient reactive group under conditions which allow for a recognition between the one or more complementing elements and the encoding elements, said contacting being performed prior to, simultaneously with, or subsequent to a transfer of the functional entity to the recipient reactive group.

25

30

23. The method according to claim 22, wherein the encoding element comprises one or more encoding sequences comprised of 1 to 50 nucleotides and the one or more complementing elements comprise a sequence of nucleotides complementary to one or more of the encoding sequences.

24. The method of claims 22 or 23, wherein the recipient reactive group is an amine group, which may be part of a chemical scaffold, and the linkage between the functional entity precursor and the scaffold is of the general chemical structure:

5 **Scaffold-NH-X(=V)-Functional entity precursor**

In which

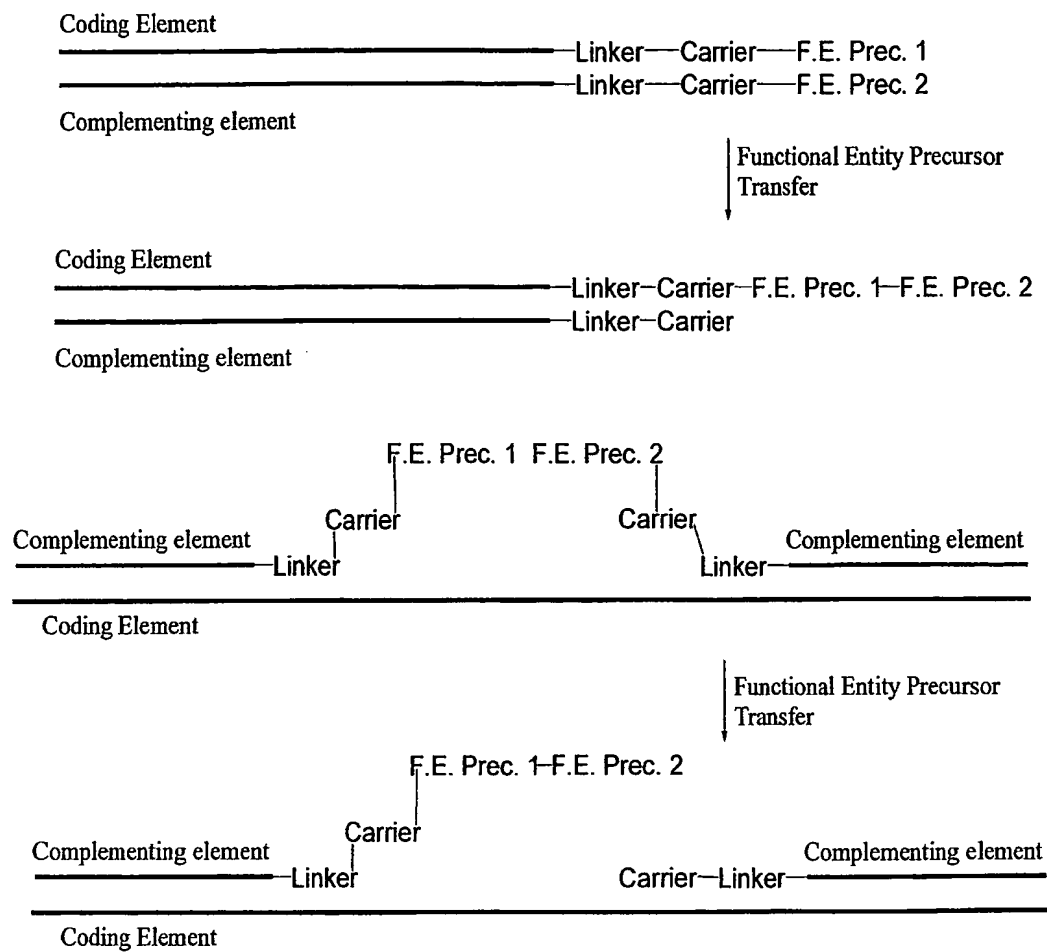

X = -C-, -S-, -P-, -S(O)-, or -P(O)-, and

V = O, S, NH, or N-C₁-C₆ alkyl.

10

25. The method according to claim 24, wherein X is -C- and V is O.

Natural Base Pairs

The image displays eight chemical structures of nucleoside derivatives, arranged in two columns. Each structure is labeled with 'Backbone' to indicate the attachment point for the sugar-phosphate backbone.

- Top Left:** A purine derivative (Adenine) with an amino group at the 6-position. The label 'Backbone' is positioned above the 9-position nitrogen.
- Top Right:** A purine derivative (Guanine) with an amino group at the 2-position. The label 'Backbone' is positioned above the 9-position nitrogen.
- Middle Left:** A pyrimidine derivative (Cytosine) with an amino group at the 4-position. The label 'Backbone' is positioned below the 1-position nitrogen.
- Middle Right:** A pyrimidine derivative (Uracil) with no amino groups. The label 'Backbone' is positioned below the 1-position nitrogen.
- Bottom Left:** A purine derivative (Adenine) with an amino group at the 6-position. The label 'Backbone' is positioned below the 9-position nitrogen.
- Bottom Right:** A purine derivative (Guanine) with an amino group at the 2-position. The label 'Backbone' is positioned below the 9-position nitrogen.

(54) Title: A BUILDING BLOCK CAPABLE OF TRANSFERRING A FUNCTIONAL ENTITY

(57) Abstract: A building block having the dual capabilities of transferring the genetic information e.g. by recognising an encoding element and transferring a functional entity to a recipient reactive group is disclosed. The building block can be designed with an adjustable transferability taking into account the components of the building block. The building block may be used in the generation of a single complex or libraries of different complexes, wherein the complex comprises an encoded molecule linked to an encoding element. Libraries of complexes are useful in the quest for pharmaceutically active compounds.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claims Nos.: 1-25 (in part)
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORTInternational Application No. **PCT/DK 03 00174****FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210**

Continuation of Box I.2

Claims Nos.: 1-25 (in part)

Present claims 1-25 relate to an extremely large number of possible building blocks. In fact, the claims contain so many options that a lack of clarity within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Moreover, support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found for only a very small proportion of the building blocks claimed. Consequently, the search has been carried out for those parts of the application which do appear to be clear and supported, namely those parts of the application relating to the building blocks of claim 1 where the complementing element is a nucleic acid or a derivative thereof as in claims 16 and 17 AND where the C-F connecting group is as defined in claim 15.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
